AB - J09002441 The printer has a roller actuated by a motor (5) to send out  
the label paper (1) having perforations, to paper conveyor (3).  
- Two sets of pressing units (12) are arranged at a predetermined space  
from the paper conveyor and combined with a contact piece to support  
the paper conveyor in paper conveyance. The pressing units press the  
printing surface of the paper to cut the label paper through the  
perforation.  
- ADVANTAGE - Maintains cutting capacity for long time. Does not cut  
label paper except in perforation area even when position of  
perforation is shifted in direction. Easily cut label paper by  
pressing unit by pulling both sides of perforation. Completely  
eliminates printing impossible area even when printer does not return  
paper.
